

Product Name : Mesdopetam
Cat. No. : PC-47114
CAS No. : 1403894-72-3
Molecular Formula : C₁₂H₁₈FNO₃S
Molecular Weight : 275.338
Target : Dopamine Receptor
Solubility : 10 mM in DMSO

Biological Activity

Mesdopetam (IRL790) is a novel dopamine transmission modulator and dopamine D3 receptor antagonist with K_i/IC₅₀ of 0.09/0.41 μM.

IRL790 also shows sub-micromolar affinities at DA D2 and σ₁ receptors, and micromolar affinities at 5-HT_{1a}, 5-HT_{2a}, and 5-HT₇ receptors, does not show any agonist-like properties at D2, D3, 5-HT₂, or 5-HT₇ receptors.

IRL790 displays balancing effects on aberrant motor phenotypes, reducing L-DOPA-induced dyskinesias in the rodent 6-hydroxydopamine lesion model and reducing psychostimulant-induced locomotor hyperactivity elicited by pretreatment with either d-amphetamine or dizocilpine, without negatively impacting normal motor performance.

IRL790 is active in models of perturbed dopaminergic and glutamatergic signaling, including rodent 6-hydroxydopamine L-DOPA-induced dyskinesias and psychostimulant-induced hyperactivity, in a dose range that does not impair normal behavior.
